CivicResolve

Citizen grievance portal | Completion summary

WORK COMPLETED
29 October 2026

Overview

CivicResolve now connects citizen complaint submission and tracking with officer handling and administrator oversight. This report summarizes the implemented portal work and the verification completed so far.

103	3	3
automated tests passed	role portals covered	complaint workflow roles

Citizen experience

- Complaint report submission with sector selection, validation, and optional phone verification.
- Citizen dashboard, complaint list, complaint details, profile, and complaint-activity views use the signed-in citizen's records.
- Public complaint tracking and report-submission confirmation pages are available.

Officer workspace

- Dashboard workload counts, department/assignment complaint list, and search/status filters.
- Authorized officers can review complaint details and submit status, notes, and proof-link updates.
- Officer escalation and complaint-activity pages are connected to the existing records.

Administrator workspace

- Dashboard metrics and recent complaints, with complaint search and status filtering.
- Complaint actions include assignment, status updates, escalation, and deletion.
- Department summaries are derived from the official sector-to-department directory; administrators can create officer accounts and manage users.

Backend and reliability

- Role and ownership checks protect web routes and complaint operations.
- Escalations record a reason, department-matched officer, level, and status; resolving a complaint resolves open escalations.
- Lazy-loaded complaint relationships are fetched for portal views; regression tests cover route rendering and authenticated form actions.

Visual improvements

- Landing-page hero fills the viewport below the navigation bar, including small screens.
- Footer text and links use higher-contrast colors; long account names no longer overflow the role sidebar.

Verification and scope notes

The complete Maven test suite passed: 103 tests, with no failures or errors. A separate browser-based check against a running application was not available during this work. Notification pages currently show complaint activity; a dedicated persistent notification model and unread/read lifecycle have not been added.

This is a work-to-date summary, not a claim that every possible production integration (for example live SMS/email credentials or persistent notifications) is configured.
